

Geometric averaging: symmetrizes each cell individually, no cross-block coupling

input: 16 independently-trained cells

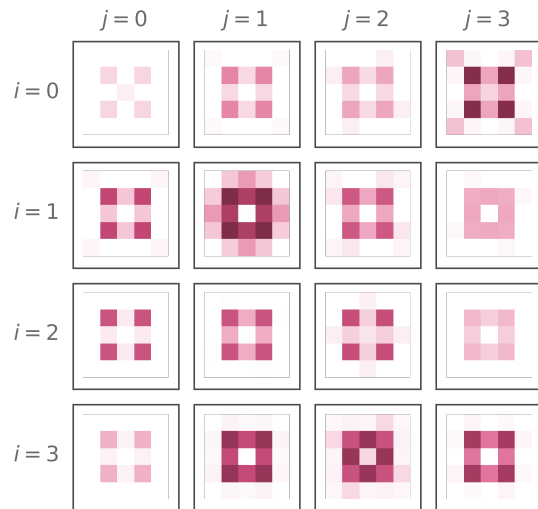

(no group structure imposed)

per-cell average

$$\text{cell}_{ij} \mapsto \frac{1}{|G|} \sum_k R^k \cdot \text{cell}_{ij} \text{ (intra-block)}$$

output: each cell C_4 -symmetric

16 distinct cells · each individually C_4 -symmetric
