

Geometric averaging: symmetrizes each cell individually, no cross-block coupling

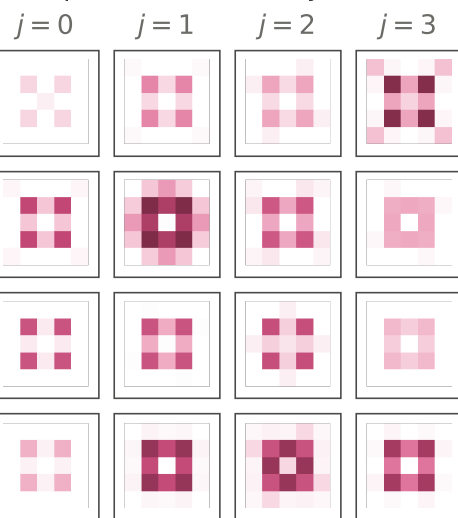

input (η) : 16 independently-trained cells

(no group structure imposed)

per-cell average
 $\text{cell}_{ij} \mapsto \frac{1}{|G|} \sum_k R^k \cdot \text{cell}_{ij}$ (intra-block)

output: each cell C_4 -symmetric

16 distinct cells · each individually C_4 -symmetric
